

LIFE CYCLE OF AN ANGIOSPERM

Please write the notes next to each section.

1. Angiosperm

The job of a flower is to reproduce. The plant makes a flower.

2. Pollination

The pollen sticks to the stigma.

3. Fertilization

The sperm from the pollen joins with the egg.

4. Fruit Formation (add between fertilization and seed dispersal)

A fruit forms with seeds inside. Anything with seeds inside it is a fruit.

5. Seed Dispersal

Something (wind, water, animal) moves the seed to another place.

6. Seed Growth

A new plant grows
